savVi Event Dispatcher
Managing Real-Time Alerts on the Move

In today's fast-paced world, receiving alerts in the control room is not always a convenient option. savVi Event Dispatcher was specifically designed to enable notification of real-time events via a range of mobile communication applications. When guards are on patrol, or otherwise occupied and not present in the control room, they can select their preferred communication tool to continue receiving real-time notifications. With maximum flexibility for personalized notifications via email, SMS, MMS or other application, savVi Event Dispatcher enhances the users' ability to respond appropriately to emerging events, in real-time.

What is savVi Event Dispatcher?

When savVi detects an event in real-time (eg. person crossing a line, person moving in an area, etc. as defined by the user), a notification is sent to the VMS/video alarm management software. In parallel, when using the Event Dispatcher, a notification is sent to trigger a communication service such as the sending of an email, SMS, MMS or other. The Event Dispatcher offers built-in capabilities (eg. sending emails) or can be customized to support additional communication applications (eg. video monitoring alarm systems).

- **Email Generation:** The user defines the email recipients, mail server identification and credentials. The event notification email includes the camera ID, event time and event snapshot. The email notification can be customized.
- **Other Communication Applications:** The Event Dispatcher can trigger SMSs, MMSs and more. A system integrator or IT professional can write a simple script to implement such functionality.
- **License Requirement:** savVi Event Dispatcher is available within all savVi Real-Time Event Detection licenses.
- **Software Requirement:** savVi Event Dispatcher can be installed on savVi version 5.3 and up.
