

innovi Updates - November 2021

Dear innovi User,

The following update will be included in the next innovi update that will take place 09 - November - 2021

1 **Event status updates on multiple browsers**

When an event status changes (to "opened" or tagged as "True"/ "False") on a specific station, the changed status will automatically appear on all other stations that include that event. This will be shown under the "innovi monitor" tab.

2 **Play event clip within a selected event window**

In the monitor grid view, when the cursor hovers above a selected event, an 8 second clip will play within the event window. When the cursor moves to another event, the played clip will be replaced with the original event image along a new 8 second clip that will play within the second event window.

3 **New innovi Event Monitoring MIP Plugin for Milestone XProtect integrations**

The following problems were fixed:

- **Overlay is not removed after playback**

After verifying real-time events with overlay, navigate to the "alarm monitoring" tab and select an event. The event playback will play while previous overlays will still show.

- **Overlay is not removed when switching between Smart Client views**

When rapidly switching views in Milestone Smart Client, event overlay from a specific camera will be displayed on other camera views.

To upgrade from a previous version, download the latest plugin [here](#) and follow the instructions.
